

USEFUL INFORMATION

DEYCLEAN TREATMENT

- The Deyclean treatment is a fluoride polymer which is applied on the glass surface, creating a non-stick layer, which makes the water to slide more easily, sweeping away lime and dirt residues.
- The treatment, without changing the physical properties of the glass (shine, colour, transparency, etc.) provides it with a hydrophobic surface, which makes the liquids to slide (water, oil, acetone, etc) showing remarkable advantages for the end user:
 - The glass can be cleaned more easily.
 - The glass remains clean longer.
 - It saves time and cleaning products.
 - It is protected against stains.
- The resulting treatment is steady and it cannot be removed, unless very aggressive cleaning products or very basic reactive products are used.
- Due to its application through industrial methods and under perfect cleaning conditions, its effectiveness and durability is guaranteed for at least 4000-5000 cleaning cycles.

CLEANING TIPS

- Use just water and neutral soap to clean the bath screen. If abrasive products are used, the guarantee will be no longer valid.
- Do not use products containing: Bleaches, Acids, Ammonias, Sprays, etc., these products damage the profiles, DayClean protection, glass screen-printing, watertight joints, etc.
